

# Project 1: Financial Programming with Python

FinTech Boot Camp

# Project 1

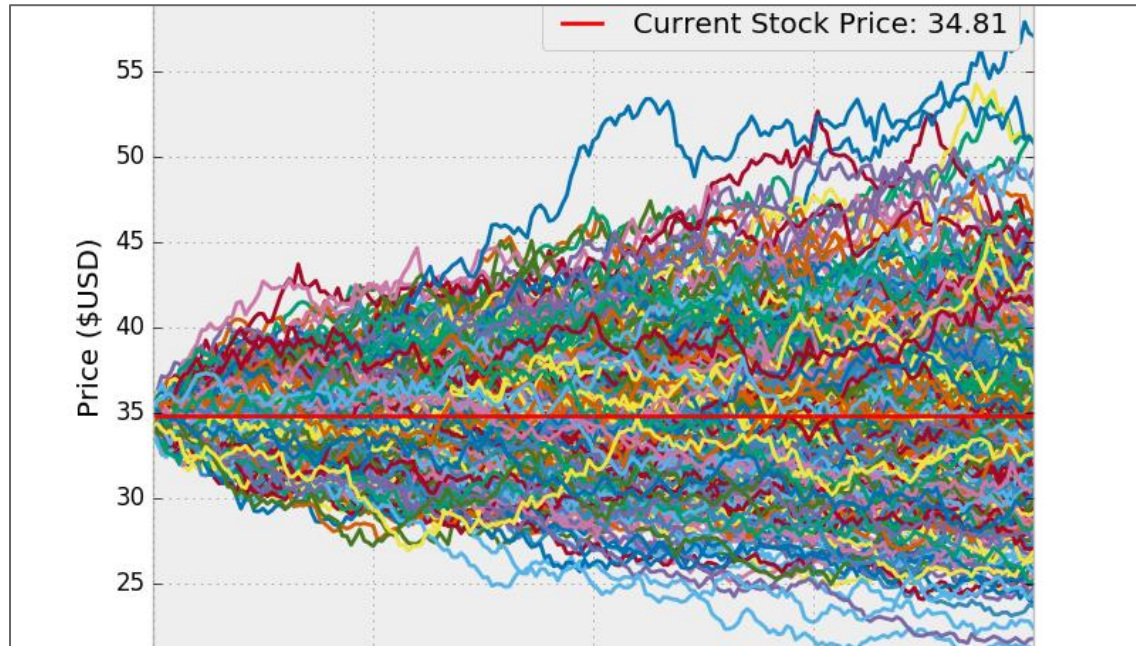

# FinTech Financial Programming with Python

# Example Project Ideas

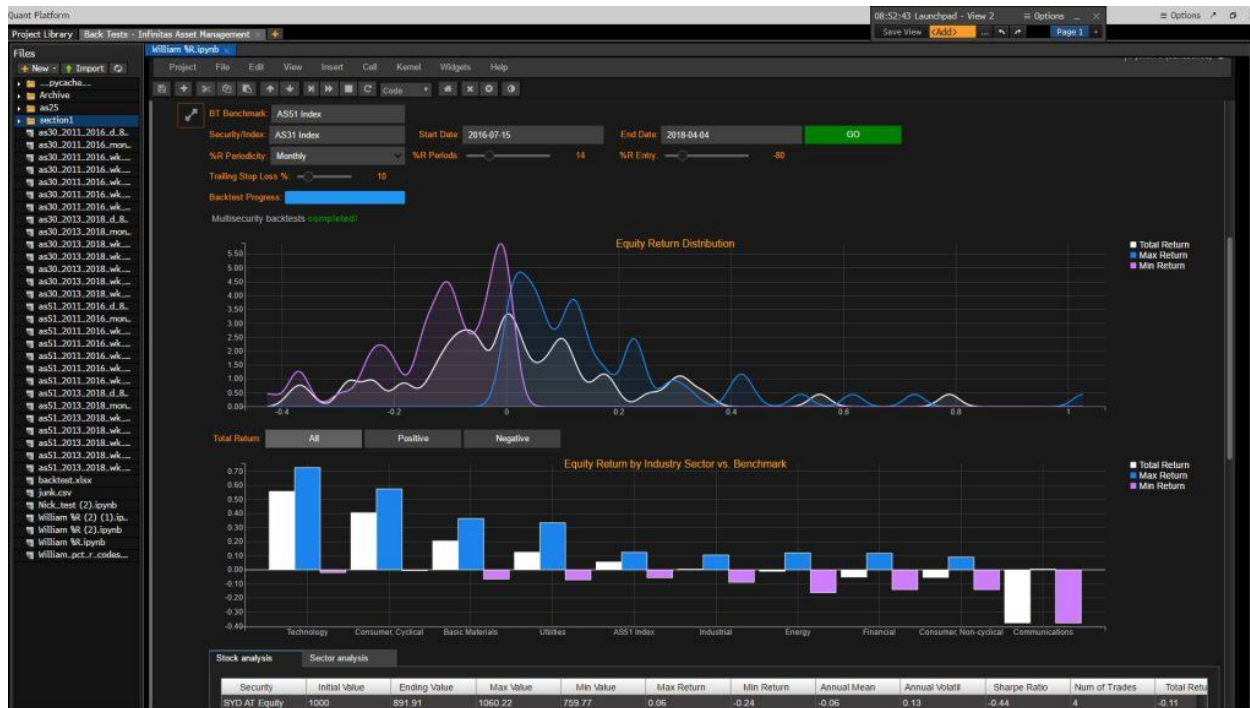

# Portfolio Analyzer

Prepare a tearsheet for a portfolio that includes calculations, tables, charts, financial models, Monte Carlo simulations and statistical analysis of portfolio performance for a given portfolio.

# Portfolio Analyzer

Create and host a dashboard for the tearsheet with interactive visualizations and a storyboard interface.

# Portfolio Analyzer

---

What do your results suggest about the current portfolio performance?  
What would you recommend customizing to improve the portfolio?

# Fund my FinTech!

Fund my FinTech is a business valuation use case. Entrepreneurs would like to fund their new business with a crowdfunding platform. In order to do that, they need to prove to potential investors that their company is viable.

# Fund my FinTech! Financial Valuation

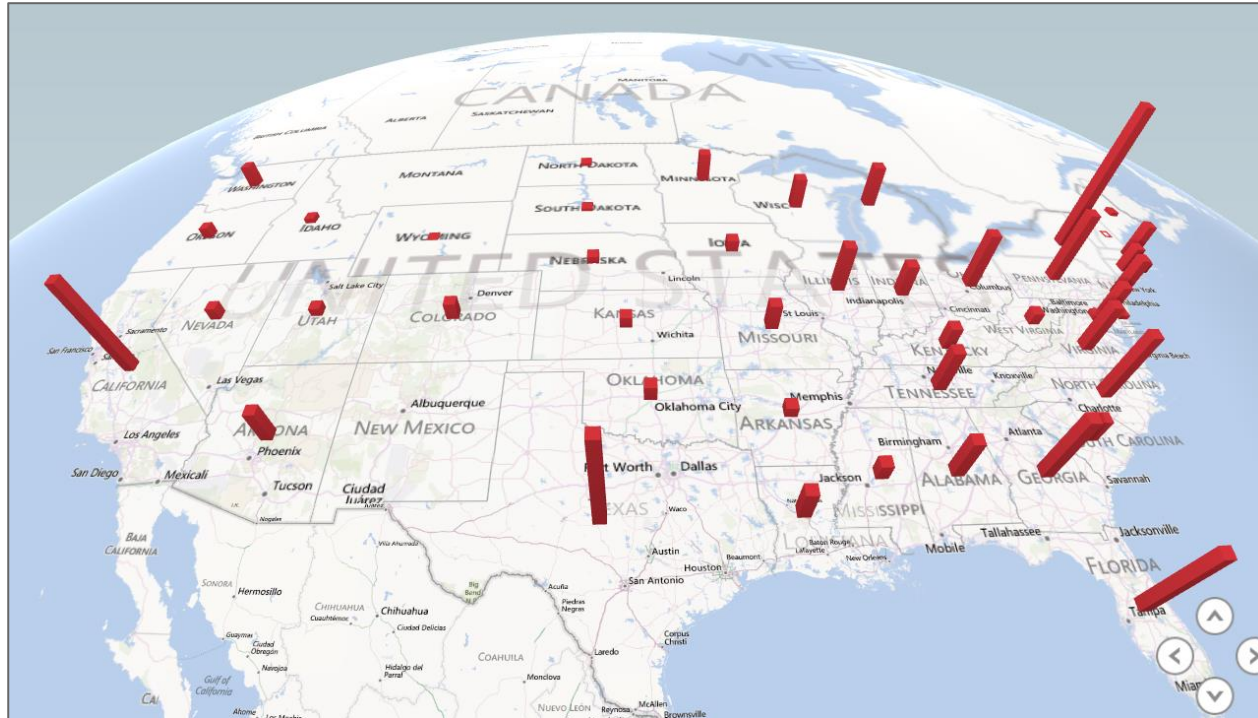

---

What metrics, measures, and models can be used to show investors that the company idea is viable?

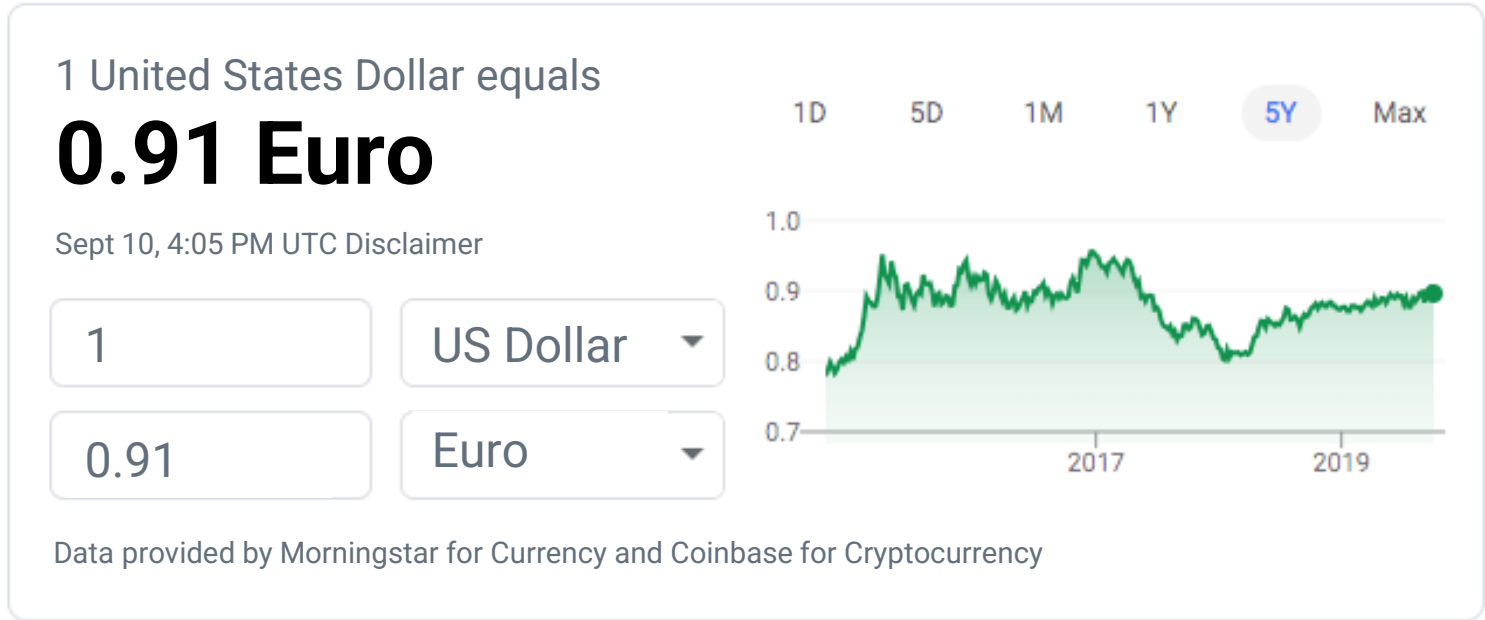

# Fund my FinTech! Location Analysis

What analysis shows that the proposed location or country for the business will be profitable? **Can you compare one location to another?**

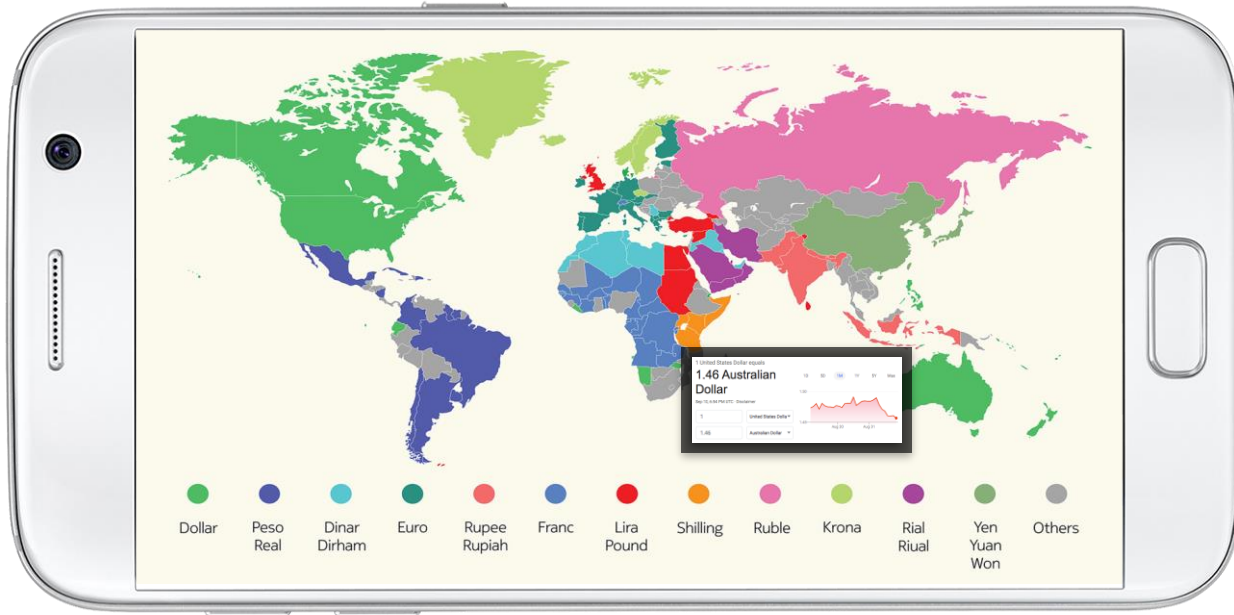

# Currency Calculator

A travel agency has hired your team to build a currency calculator into their travel planner. This calculator will be hosted as an interactive dashboard application.

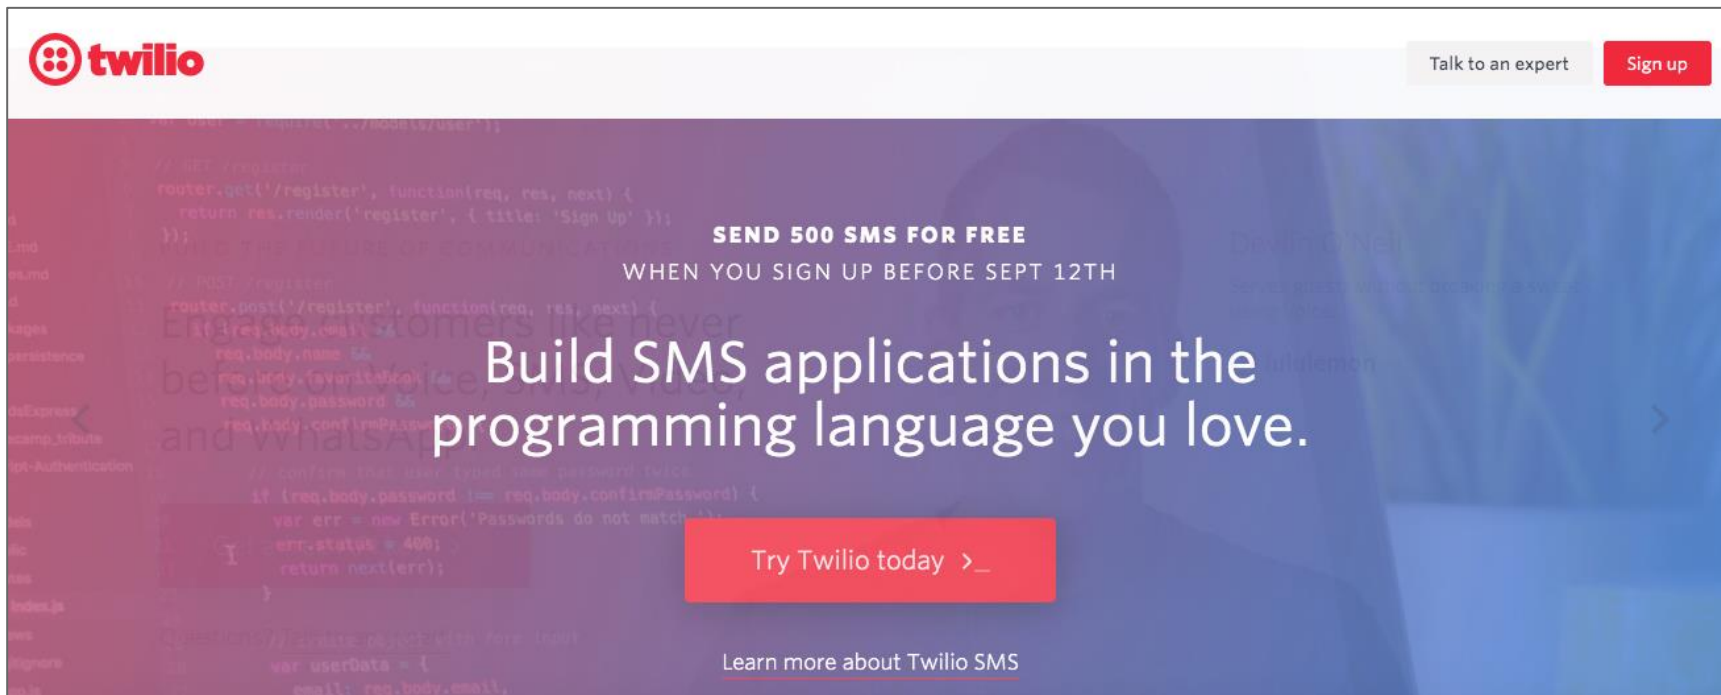

# Currency Calculator

This calculator not only provides real-time conversions to/from a variety of currencies, but it also provides interactive maps that allow travelers to view and compare exchange markets for different locations

# Currency Calculator

The application will also prepare a report on the selected locations and send that to a registered mobile number using tools such as [Twilio](#).

The image is a screenshot of the Twilio website. At the top left is the Twilio logo. At the top right are two buttons: "Talk to an expert" and "Sign up". The main content area features a large, semi-transparent code editor overlay on the left side, displaying JavaScript code for a registration endpoint. The code includes comments and logic for handling GET and POST requests to the "/register" endpoint, including password validation. Overlaid on the right side of the code is a promotional message: "SEND 500 SMS FOR FREE WHEN YOU SIGN UP BEFORE SEPT 12TH". Below this, the text "Build SMS applications in the programming language you love." is displayed in a large, white font. At the bottom right, there is a red button that says "Try Twilio today >\_" and a link that says "Learn more about Twilio SMS".

# Project Requirements

# Project Requirements

---

Your project will be graded on the following criterion:

Software Version Control

Data Collection and Preparation

Financial Programming

Documentation

Class Presentation

Teamwork

# Presentation Requirements

# Presentation Requirements

---

Your team will also prepare a formal, 10-minute presentation with the following sections:

An executive summary/overview of the project and project goals

Data Collection and Preparation

The approach that your group took in achieving the project goals

The results/conclusions of the financial application or analysis

Next Steps

Appendix with links to the GitHub repository

# Suggested Data Sources

# Suggestions for Data Sources

---

Feel free to ask us (the instructional staff) for input, but our general advice is to stick to data sources that:

Are sufficiently large.

Have a consistent format.

Ideally, contain more data than needed.

Are well-documented.

# Project Groups

**Time to divide into teams!**

# Today's Focus

# By the End of Today's Class:

---

Brainstorm possible project ideas.

Begin data research.

Write a description of the scope of your research.

# By the End of Today's Class:

---

Create a short, [1-page project proposal](#) that includes the following:

Project Title

Team Members

Project Description/Outline

Research Questions to Answer

Datasets to be Used

Rough Breakdown of Tasks

Questions?
